Policy on Wise Use of Water

Water is a rare and precious resource. It is a necessity in every society, as it is fundamental to human health, sanitation, food production, transportation, energy production, and much more.

Water is used for different purposes at Government College Women University Faisalabad. At student and faculty hostels, it is used for cooking, cleaning, washing clothes/utensils and showering. At academic Blocks, it is mainly used for drinking purposes. Students also use water for laboratory based courses and for performing research experiments. As a major proportion of students is Muslim, therefore water is utilized for religious activities, such as for observing ablution before saying prayers. It is also used for gardening and landscaping at Campus. Clearly, water is an integral part of life on campus, and conservation of this precious resource is key to ensure it does not become scarce in the future.

Shortage of clean water has become a critical global issue. The clean, purified and drinkable water is found in limited quantity. A major proportion of water is polluted and contaminated for more than one reason, which makes it detrimental not only to human health but the existence and health of animals, birds and plants is also jeopardized due to this threat. Clean water is an essential component of our life, so we need to conserve water for the future safety. If we save water, we save life and we save the whole world on the earth.

Government College Women University Faisalabad has taken judicious measures to improve water usage and efficiency on its Main and New Campuses. The conservation of rain water is made possible to be utilized for gardening and landscaping, reducing water usage by over 0.5 million gallons. The athletic fields and playgrounds are also irrigated by this reservoir.

The maintenance branch of Engineering cell has managed to fix dripping faucets and water leaks/seepage in academic blocks and hostels to stop unnecessary wastage of water.

Students are motivated and sensitized to help reduce the consumption of water in daily life. They are advised to:

- 1 - Report the dripping faucets and water leaks to the Maintenance Section of Engineering cell.
- 2- Turn off the faucet while brushing teeth, taking showers, washing clothes and dishes.
- 3- Turn the faucets at low flow, while observing ablution before saying prayers.

If we are cautious today, we can conserve water for our future.
